

- **Course Title:** Engineering Cost Analysis & Economy (ENGR 222)
- **Session:** Fall 2024
- **Instructor:** Sudipta Chowdhury  
([chowdhurys@marshall.edu](mailto:chowdhurys@marshall.edu))
- **Class Time:** TR 9.30 AM-10.45 AM
- **Office hours:** TR 11.00 AM-12.30 PM

# **Benefit-cost Analysis**

## Differences: Public vs. Private Projects

Characteristic	Public	Private
Size of Investment	Large	Small, medium, large
Life	Longer (30 — 50+ years)	Shorter (2 — 25 years)
Annual CF	No profit	Profit-driven
Funding	Taxes, fees, bonds, etc.	Stocks, bonds, loans, etc.
Interest rate	Lower	Higher
Selection criteria	Multiple criteria	Primarily ROR
Environment of evaluation	Politically inclined	Economic

# Cash Flow Classifications

**Must identify each cash flow as either benefit, disbenefit, or cost**

**Benefit (B) -- Advantages to the public**

**Disbenefit (D) -- Disadvantages to the public**

**Cost (C) -- Expenditures by the government**

***Note: Savings to government are subtracted from costs***

## B/C Relations

$$B/C = \frac{PW \text{ or } AW \text{ or } FW \text{ of benefits}}{PW \text{ or } AW \text{ or } FW \text{ of costs}}$$

**Note 1:** All terms must be expressed in same units, i.e., PW, AW, or FW

**Note 2:** Do not use minus sign ahead of costs

**Note 3:** AW is preferred

If  $B/C \geq 1.0$ , project is economically justified discount rate applied

If  $B/C < 1.0$ , project is not economically acceptable

## B/C Relations

**Conventional B/C ratio =  $(B - D) / C$**

**Modified B/C ratio =  $[(B - D) - \text{M\&O cost}] / \text{Initial Investment}$**

**Example 1.** Officials from the City of Galveston and State of Texas gathered to celebrate the start of a beach restoration project that involves dumping sand and adding anti-erosion structures. The first cost of the project is \$30 million with annual maintenance estimated at \$340,000. If the restored/expanded beaches attract visitors who will spend \$6.2 million per year, what is the conventional B/C ratio at the social discount rate of 8% per year? Assume the State wants to recover the investment in 20 years.

**Example 2.** A consultant, after 3 months of work, reported that the modified B/C ratio for a city-owned hospital heliport project is 1.7. If the initial cost is \$1 million and the annual benefits are \$150,000, what is the amount of the annual M&O costs used in the calculation? The report stated that a discount rate of 6% per year and an estimated life of 30 years were used.

### Example 3.

Calculate the B/C ratio for the following cash flow estimates at a discount rate of 10% per year. Is the project justified?

Item	Estimate
PW of benefits, \$	3,800,000
AW of disbenefits, \$/year	45,000
First cost, \$	1,200,000
M&O costs, \$/year	300,000
Life, years	20

## Profitability index analysis of revenue projects

If  $PI \geq 1.0$ , project **is** economically justified at discount rate applied

If  $PI < 1.0$ , project **is not** economically acceptable

$$\text{Conventional B/C ratio} = \frac{B - D}{C}$$

$$\text{Modified B/C ratio} = \frac{B - D - \text{M\&O}}{\text{initial Investment}}$$

If  $B/C \geq 1.0$ , accept project;  
otherwise, reject

$$PI = \frac{\text{PW of NCF}}{\text{PW of initial investment}}$$

**Example 4.** Dickinson, a large oil and gas drilling and operating corporation, has invested over the past 6 years in the installation and operation of a FOUNDATION Fieldbus H1 (FF H1) system developed by Pepperl+Fuchs of Germany. A project engineer has collected information on annual net cash flow increases ( $\Delta NCF$ ) generated by the FF H1 system and the annual investments made by Dickinson in the system. At an interest rate of 10% per year, determine the PI of this endeavor. Has it proven to be economically worthwhile?

Year	0	1	2	3	4	5	6
$\Delta NCF$ , \$10,000 per year	0	5	7	9	11	13	20
Investment, \$10,000	15	8	10	0	0	5	10

## Evaluation of Alternatives

General approach for incremental B/C analysis of two ME alternatives:

- Lower total cost alternative is first compared to **Do-nothing (DN)**
- If B/C for the lower cost alternative is  $< 1.0$ , the DN option is compared to conventional B/C ratio ( $\Delta \mathbf{B/C}$ ) of the higher-cost alternative
- If both alternatives lose out to DN option, DN prevails, unless overriding needs requires selection of one of the alternatives

Example 5. Compare two alternatives using  $i = 10\%$  and B/C ratio

Alternative	X	Y
First cost, \$	320,000	540,000
M&O costs, \$/year	45,000	35,000
Benefits, \$/year	110,000	150,000
Disbenefits, \$/year	20,000	45,000
Life, years	10	20

**Solution:** First, calculate equivalent total cost

$$AW \text{ of costs}_X = 320,000(A/P, 10\%, 10) + 45,000 = \$97,080$$

$$AW \text{ of costs}_Y = 540,000(A/P, 10\%, 20) + 35,000 = \$98,428$$

Order of analysis is X, then Y

**X vs. DN:**  $(B - D)/C = (110,000 - 20,000) / 97,080 = 0.93$  **Eliminate X**

**Y vs. DN:**  $(150,000 - 45,000) / 98,428 = 1.07$  **Eliminate DN**

Select Y

Example 6. Must select one of two alternatives using  $i = 10\%$  and  $\Delta B/C$  ratio

Alternative	X	Y
First cost, \$	320,000	540,000
M&O costs, \$/year	45,000	35,000
Benefits, \$/year	110,000	150,000
Disbenefits, \$/year	20,000	45,000
Life, years	10	20

**Solution:** Must select X or Y; DN not an option, compare Y to X

$$AW \text{ of costs}_X = \$97,080$$

$$AW \text{ of costs}_Y = \$98,428$$

**Incremental values:**  $\Delta B = 150,000 - 110,000 = \$40,000$

$$\Delta D = 45,000 - 20,000 = \$25,000$$

$$\Delta C = 98,428 - 97,080 = \$1,348$$

**Y vs. X:**  $(\Delta B - \Delta D)/\Delta C = (40,000 - 25,000)/1,348 = 11.1$  **Eliminate X**

**Select Y**
